Around 1/48 people in the United States
Experience vision loss

With 1/7 people experiencing
vision loss being blind

Universal Design

The concept of designing for the few with the most drastic problem will also benefit the general population that requires a more general solution.

Most common example is the ergonomic grip of hand held potato peelers

Social Model of Disability

The social model of disability argues that disability is caused by barriers in society. Such as, environment, people's attitudes and organizations.

According to this definition it expands the userbase of products aimed at the disabled community as disability can be caused by situations both permanent and temporary.

Permanent

Permanent disabilities fall into 2 categories: Born and Acquired

Born

People who are born disabled due to genetics or other factors
Ex: Born without an arm

Acquired

People who acquire a disability later in life due to an injury or disease
Ex: Losing an arm

Situational

People who are temporarily disabled due to a situation and benefit from environmental accommodations put in place for the permanently disabled
Ex: Carrying Groceries

Temporary

Temporary disabilities have 2 main categories:
Injury and Situational

Injury

People who are temporarily disabled due to injury, and require accommodations for a period of time
Ex: Broken arm

USER MOLECULES

USER

PROBLEM

SOLUTION

Blind, varies in ability but generally can distinguish high contrast

Struggles to identify containers due to **lack of tactile labeling and identical forms** across product lines

Create a **tactile non-braille reliant system** for organization with unique shapes and textures

Low vision, has some sight but it is highly reduced

Struggles to identify containers due to **low contrast** labelling, **small fonts** and unavailability of tactile labels

Create **higher contrast** through color and texture to assist with organization and identification.

20/20 vision, or vision impaired with correctional lenses

Unable to find containers fast due to overcrowding in cabinets and **non-visible labels**

Create an **identification system** that does not rely on side visibility of containers

JOINT
SOLUTION

Create a **tactile identification system** that does not rely on 2D graphic space for identification and organization

GOODWILL VISION ENTERPRISES

Goodwill Vision Enterprises is a subset of Goodwill that focuses on vision services in the fingerlake region

They provide occupational therapy, helping people navigate daily life and spaces without vision.

A variety of people use their services, from younger children to older adults who lost vision later in life, with most receiving occupational therapy being over 50.

Goodwill Vision Enterprises: User Research

Management Techniques

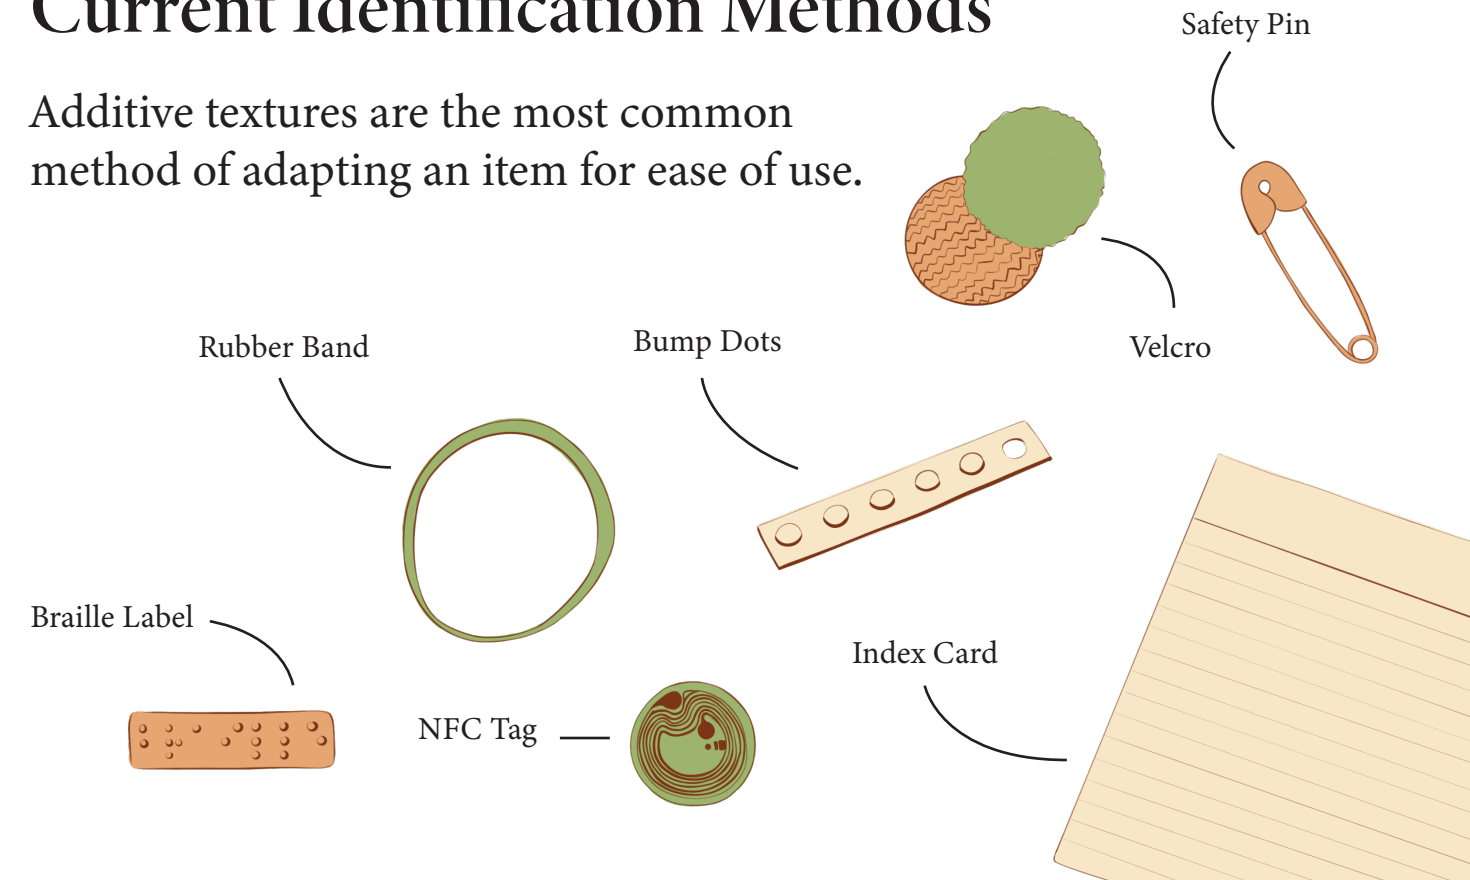

Consistency is key. Keeping things in the same place allows for ease of use and less confusion. This creates a strict organization system relying on memorization which can be disrupted if something is misplaced.

Stress Areas

Mental strain is caused by memorization. This is further exacerbated when living with sighted people, as they move objects from their designated spots.

Current Identification Methods

Additive textures are the most common method of adapting an item for ease of use.

Problem Statement

Investigating spice packaging allowing for ease of navigation and identification through form and materials for people with low vision and blindness

Interaction Testing

Additive Lines

How do you start to create an identification system using form placement of pre-existing spice bottles?

Texture Association

What textures do people associate with different spice categories and why are they associated?

Tray Table

How do you create an external form based system to allow for consistent placement of bottles?

Additive Lines

How do you start to create an identification system using placement and simple forms on pre-existing spice bottles?

The test required a blind folded individual to memorize a bottle and then find it again out of a lineup

Questions

How simple can I make a tactile system?

How does line placement affect identification?

Findings

People could easily identify the bottles

While bottles were identifiable, they didn't have an association with specific spices - how do you create that association?

Could lines represent broader categories and not individual spices?

Texture Association

What textures do people associate with different spice catagories and why are they associated?

The test required blindfolded individuals to place textures in 3 piles: powders, leave and miscellaneous

Textures

Dots

Lines

Sandpaper

Clear

Triangle

Feels similar to sandpaper

Reminds me of my cat

"Kinda hurts, therfore Spicy?"

Catagories

Powders

Leaves

Miscellaneous

Tray Table

How do you create an external form based system to allow for consistent placement of bottles?

This test required blindfolded individuals to place the correct shaped bottle in the right spot

Questions

How do I create an intuitive external system?

What shape gets mistaken for each other

Findings

Tray was incredibly difficult to use, bottles kept getting knocked over out of place

non-intuitive to use

Concept Development

IDEATION

INITIAL PROTOTYPES

1st print

- Assess Scale
- Finalize lid tolerances

Text and
Lid Creation

- Apply text and assess scale
- Separate lid into pieces to allow for hinge

Kerning and
Lid Development

- Align kerning of braille and raised letters
- Slope lid for easier removal and add texture

FINAL PROTOTYPES

Textured lid

PLA 3D printing

SLA Resin Print
Raised Large Print
Standardized Braille

Final Design

About the Designer

Kimberly DeSantis

kimberlydesantisdesign.com

I am an industrial designer focused on user research to create a seamless user experience for a variety of ability levels and consumer types. This is done through research of textures and material to optimize user interface.

Outside of product development, I enjoy reading, puzzles and illustration with them often blending into each other. Overall I like making things and learning new ways to do so.

Special Thanks

Special thanks to everyone who has helped and supported me throughout this project including family, friends and professors
